Basic Phonics

There are several possible positions about the role of phonics in reading, although they do not exhaust all the possibilities.

Intensive, Systmatic Phonics. Ehri (2004) defines this position as follows: "Phonics instruction is systematic when all of the major letter-sound correspondences are taught and covered in a clearly defined sequence .." (p. 180).

This position claims that we learn to read by first learning the rules of phonics, that is, we learn to read by sounding out or reading outloud ("decoding to sound"). It also asserts that our entire knowledge of phonics must be deliberately taught and consciously learned: Intensive instruction is "essential" (Ehri, 2004). Proponents of Intensive Systematic Phonics tell us that learning to read is hard work (Ehri, 2004).

Ehri gives us some idea of what the "major" rules are: They include "long and short vowels and vowel and consonant digraphs consisting of two letters representing one phoneme, such as oi, ea, sh, and th. Also, phonics instruction may include blends of letter sounds that represent larger subunits in words such as consonant pairs (e.g. st, bl), onsets, and rimes" (p. 180). (It is unclear what happens to the "minor" rules, whether they are also taught or whether they acquired incidentally. One must ask: if the minor rules can be acquired, without direct instruction, why can’t all phonics rules be acquired?)

Basic Phonics: According to this position, it is helpful to teach some rules of phonics, but just the basics, just the straight-forward rules. (I introduce the term Basic Phonics here, attempting to provide a label for a position that already exists, but has not, in my view, been made explicit.)

According to Basic Phonics, we learn to read by actually reading, by understanding what is on the page. Most of our knowledge of phonics is the result of reading; the more complex rules of phonics are subconsciously acquired through reading (Smith, 1994).

A conscious knowledge of some basic rules can help children learn to read by making texts more comprehensible. Smith (1994) demonstrates how this can happen: The child is reading the sentence "The man was riding on the h____." and cannot read the final word. Given the context and knowledge of ‘h’ the child can make a good guess as to what the final word is. This won’t work every time (some
readers might think the missing word was "Harley"), but some knowledge of phonics can restrict the possibilities of what the unknown words are. (One could subdivide Basic Phonics into sub-positions, into those who claim that learning the basics is essential and those who claim it is helpful.)

Basic Phonics appears to be the position of authors of Becoming a Nation of Readers, a book widely considered to provide strong support for phonics instruction:

"...phonics instruction should aim to teach only the most important and regular of letter-to-sound relationships ... once the basic relationships have been taught, the best way to get children to refine and extend their knowledge of letter-sound correspondences is through repeated opportunities to read. If this position is correct, then much phonics instruction is overly subtle and probably unproductive" (Anderson, Heibert, Scott and Wilkinson, 1985, p.38).

Zero Phonics: This view claims that all phonics rules can be acquired by reading, and that direct teaching is not necessary or even helpful.

The evidence

An argument against intensive, systematic phonics is the claim that many rules are very complex and many don’t work very well. As Smith (2003) notes, they are "unreliable ... there are too many alternatives and exceptions ... 300 ways in which letters and sounds can be related" (p. 41). In fact, Smith points out, most of the words of the English language are "spelled irregularly" and it is a real challenge to write "decodable text." (Some have claimed that the rules of phonics that appear not to work very well can be repaired and should be taught. In Krashen (2002), I argue that some recent attempts to state better sound-spelling generalizations have resulted only in more complex rules that are only slightly more efficient. )

The National Reading Panel (NICHD, 2000) concluded that the experimental research supports intensive systematic phonics. Garan (2001), in an examination of this report, noted that the impact of intensive phonics is strong on tests in which children read lists of words in isolation. But it is less evident for tests of reading comprehension, and what is most important, it is miniscule for tests of reading comprehension given after grade 1, tests which include more complex texts with more irregular words. Thus, intensive phonics instruction may only help children develop the ability to read words in isolation, an ability that will emerge anyway with more reading.
If the Basic Phonics position is correct, which rules are teachable and useful? Most likely, experienced professionals will agree that most initial consonants can be taught and learned and applied to text by small children, but some rules will be impossible for six year olds (and most adults), rules such as this one, recommended by Johnson (2001): "the a-e combination is pronounced with the long vowel and the final e silent (except when the final syllable is unaccented - then the vowel is pronounced with a short-i sound, as in "palace," or the combination is "are," with words such as "have" and "dance" as exceptions).

The great misunderstanding

There is certainly strong support among the public and the media for "phonics" instruction. What is not clear is whether the support is for Intensive Systematic Phonics, or Basic Phonics. Whole language advocates are regularly accused of supporting the Zero Phonics position, but most actually support Basic Phonics, maintaining that basic phonics is one way to help make texts more comprehensible. Public opinion might be much closer to the whole language view than to the extreme position taken by the National Reading Panel.

### INTENSIVE SYSTEMATIC PHONICS
phonics taught in sequence  
all "major" rules  
all rules consciously learned  
reading = practice of learned rules

### BASIC PHONICS
no optimal sequence  
consciously learn only basic rules  
most rules subconsciously acquired  
reading = source of most phonics knowledge

### ZERO PHONICS
rules subconsciously acquired  
reading = source of phonics knowledge
Basic Phonics Rules. When it comes to rules, there are always exceptions! That's one of the things which makes English such a hard language to learn. When two vowels are together, the 1st one is dominant and the 2nd stays silent. Specific combinations of two or more letters are called letter blends. There is a simple phonics song at the bottom of this page which demonstrates some of the basic phonics rules. Teaching Reading. Homeschoolers use many different methods for teaching reading. Basic phonics rules help us to read and understand the English language. As a teacher of literacy, I know these rules help my students (both children and adults) with the more difficult aspects of reading, writing and speaking English. What is phonics? Phonics involves the relationship between sounds and their spellings. The goal of phonics instruction is to teach students the most common sound-spelling relationships so that they can decode, or sound out, words. This decoding ability is a crucial element in reading success. Why is phonics instruction important?
